

5/10/23

MAD Assignment - 1

Ans-1 → One significant trend that was shaping the android platform & mobile app industry was the growth of Progressive web apps (PWAs) & their impact on native android app development.

* PWAs

- PWAs are web applications that offer a native app like experience within a web browser. They leverage modern web technologies to provide features such as offline access, push notifications & a responsive design.

* Impact on android app Developers:

- Reduced Development effort: Developers could choose to build PWAs instead of traditional native android apps, reducing the need for separate codebases & resources for different platforms. This could save time & effort.

- Declare the service in the manifest: In the android manifest XML file, declare the service with its name & intent filter.

```
<service android:name=".MyService"/>
```

- Implement the service's functionality: Write the logic for the service inside the overridden methods.

(1)

- Start the service: To start the service, create an intent that specifies the service's class & call `startService()` with the intent.

- Optionally, bind the service.

- Stop or unbind from the service: You can stop a service using `stopService()` or unbind it from using `unbindService()`.

Ans-2 LayoutInflater is used to create a new view object from one of your XML layouts. findViewById just gives you a reference to a view that has already been created.

- Dynamic UI creation: Android apps often need to create & display UI components dynamically based on user interactions, data or runtime conditions.
- Separation of Concerns: Separating the UI layout definition from the code that manages it helps maintain a clear separation of concerns.

* How it works:

- Layout definition: Developers define the layout for the custom dialog using an XML layout file.

- Dialog creation: A custom dialog is created & associated with the XML layout. Developers can set properties for the dialog, such as its size, style & specific behaviors.

(2)

- (ii) Displaying the dialog: When needed the custom dialog can be displayed to the user.
- (iv) User Interaction: Users can interact with the elements within the custom dialog, entering text, clicking buttons.
- (v) Handling Actions: Developers can define actions or event handlers for the UI elements within the custom dialog to respond to user input or perform specific tasks.

* Examples:

(i) Login Display:

- Purpose: A custom dialog for user login or authentication.
- Layout: The dialog may contain edit texts for username and password, a "login" button & "forget password".

(iii) Code Reusability: Developers can reuse layouts.

(iv) Localization & Theming.

(v) Efficiency

(vi) Custom Views

Ans-3

In android applications a 'custom Dialog box' often is a UI component that allows developers to create a customized pop-up dialog window that can display information, collect user input or perform various actions.

=> How it works:

- (i) Layout Definition: Developers define the layout for the custom display using an XML file layout.
- (ii) Dialog Creation: In code, a custom dialog is created & associated with the XML layout. Developers can set properties for the dialog such as its size, style & specific behaviour.
- (iii) Displaying the Dialog: When needed, the custom display can be displayed to the user.
- (iv) User Interaction: Users can interact with the elements within the custom dialog, entering text, clicking buttons.

* Examples

(i) Login Display:

- Purpose: A custom dialog for user login.
- Layout: The dialog may contain edit texts for username & password, & "login" button & "forget password".
- Usage: Displayed when the user needs to login.

(ii) Confirmation Dialog:

- Purpose: A dialog that asks the user for confirmation before proceeding with a critical action.
- Layout: Contains a message describing the action & 'yes' & 'No' buttons.
- Use case: Used to prevent accidental actions like deleting data.

(iii) Custom picker Dialog:

- Purpose: A dialog with a custom picker such as a date picker, time picker or color picker.
- Layout: It includes the picker widget & 'OK' & 'Cancel' buttons.

(iv) Information Dialog:

- Purpose: Displaying informative messages or additional details.
- Layout: Contains text or multimedia elements to inform.
- Use case: Used for displaying pop up help message, terms of service.

(5)

Ans-4 For Activities, Services & the Android manifest file work together to create the structure & functionality of an app.

(i) Activities:

- Role: It represents individual screens or user interfaces in an Android app.
- Eg: Imagine a simple email app with two activities, one for composing emails & another for viewing the inbox.

(ii) Services:

- Role: Services are background components that perform long-running operations without a user interface.
- Eg: In our email app example, a service could be used to periodically check for new emails in the background & update the inbox.

(iii) Role: The Android Manifest File:

- Role: The AndroidManifest.xml file is a configuration file that defines essential info about the app.
- Eg: In this, you specify which activities & services the app contains their properties & any permission req.

(6)

Ans-5 Examples

(i) Component declaration: The android manifest file is where you declare all the components of your android application, including activities, services, broadcast receivers & content providers.

```
<?xml version="1.0" encoding="utf-8" ?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.example.myapplication">

    <uses-permission android:name="android.permission.CAMERA" />
    <uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />

    <activity
        android:name=".MainActivity"
        android:label="@string/app_name"
        android:theme="@style/Theme.AppCompat"
        android:exported="true">
        <intent-filter>
            <action android:name="android.intent.action.MAIN" />
            <category android:name="android.intent.category.LAUNCHER" />
        </intent-filter>
    </activity>

    <service
        android:name=".MyService"
        android:exported="false">
    </service>

    <receiver
        android:name=".MyReceiver"
        android:exported="false">
    </receiver>

    <provider
        android:name=".MyContentProvider"
        android:authorities="com.example.myapplication"
        android:exported="false">
    </provider>

</manifest>
```

(ii) Application Configuration: This includes setting the app's theme, icon, label, version info. & defining the min android API level etc.

```
<?xml version="1.0" encoding="utf-8" ?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.example.myapplication">

    <uses-permission android:name="android.permission.CAMERA" />
    <uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />

    <activity
        android:name=".MainActivity"
        android:label="@string/app_name"
        android:theme="@style/Theme.AppCompat"
        android:exported="true">
        <intent-filter>
            <action android:name="android.intent.action.MAIN" />
            <category android:name="android.intent.category.LAUNCHER" />
        </intent-filter>
    </activity>

    <service
        android:name=".MyService"
        android:exported="false">
    </service>

    <receiver
        android:name=".MyReceiver"
        android:exported="false">
    </receiver>

    <provider
        android:name=".MyContentProvider"
        android:authorities="com.example.myapplication"
        android:exported="false">
    </provider>

    <application
        android:allowBackup="true"
        android:icon="@mipmap/ic_launcher"
        android:label="@string/app_name"
        android:roundIcon="@mipmap/ic_launcher_round"
        android:supportRtl="true"
        android:theme="@style/Theme.AppCompat">
    </application>

</manifest>
```

(7)

(iii) Permission: You declare the permissions your app require to access various system resources & data, such as the camera, location, internet.

```
<?xml version="1.0" encoding="utf-8" ?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.example.myapplication">

    <uses-permission android:name="android.permission.CAMERA" />
    <uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />

    <activity
        android:name=".MainActivity"
        android:label="@string/app_name"
        android:theme="@style/Theme.AppCompat"
        android:exported="true">
        <intent-filter>
            <action android:name="android.intent.action.MAIN" />
            <category android:name="android.intent.category.LAUNCHER" />
        </intent-filter>
    </activity>

    <service
        android:name=".MyService"
        android:exported="false">
    </service>

    <receiver
        android:name=".MyReceiver"
        android:exported="false">
    </receiver>

    <provider
        android:name=".MyContentProvider"
        android:authorities="com.example.myapplication"
        android:exported="false">
    </provider>

    <application
        android:allowBackup="true"
        android:icon="@mipmap/ic_launcher"
        android:label="@string/app_name"
        android:roundIcon="@mipmap/ic_launcher_round"
        android:supportRtl="true"
        android:theme="@style/Theme.AppCompat">
    </application>

</manifest>
```

(iv) Intent filters.

(v) App permission.

Ans-6 Resources are the additional files & static content that your code uses, such as bitmaps, layout def's, user interface strings, animation instructions & more.

Resources are used for anything from defining colors, images, layout, menus & string values.

* Resources types overview:

(i) Animation resources: Define pre-determined animations. frame animations are served in res/drawable & accessed from the R.drawable class.

(ii) Color state list resources: Define a color resource that changes based on the view state. Served in res/color & accessed from the R.color class.

(iii) Drawable resources: Define various graphics with bitmaps or XML.

(8)

- (iv) Layout resources: Defines the layout for your app UI.
- (v) Menu resources: Defines the content of app menus.
- (vi) String resources
- (vii) Style: Defines look & format for UI elements.

Ans-7 (i) Declare the service in the manifest: In the android - Manifest.xml file, declare the service with its name & intent filter.

⇒ `<service android:name=". MyService" />`

(ii) Implement the service's functionality:

- Write the logic for the service inside the overridden methods.

(iii) Start the service: To start the service, create an 'intent' that specifies the service's class & call 'startService()'.

(iv) Optionally, bind the service.

(v) Stop or unbind from the service:

- You can stop a service using 'stopService()' or unbind from using 'unbindService()'.
